Project Partners

- > UConn CLEAR/NEMO
- Center for Watershed Protection
- Horsley & Witten Group
- UConn Architectural & Engineering Services
- UConn Office of Environmental Policy
- Town of Mansfield
- > CTDEP
- > EPA CWA Section 319 Nonpoint Source Program

Total

 The maximum amount of a pollutant a waterbody can receive without adverse impact to designated uses

Maximum

 Under section 303(d) of the Federal Clean Water Act (CWA), states are required to develop TMDLs for impaired waters

Daily

 The end result is a Water Quality Management Plan with quantitative pollutant load reduction targets

Load

 Generally expressed as pollutant concentration targets, % reductions in pollutant levels, or mass load reductions

Connecticut Probable Sources of Impairments for Threatened and Impaired Rivers and Streams Reporting Year 2008

Linking the Bugs to IC...

% of Reference Community compares 7 metrics- Taxa Richness, Modified HBI, Scraper/Filterer, EPT/Chironomidae, % Dominant Taxa, EPT Index, Community Loss

(Bellucci, CTDEP)

Why Impervious Cover?

DEP Stressor ID Study identified a complex array of pollutants generated from storm water runoff as most probable cause of impairment

- Simplifies complex impacts but based on good science
- Good correlation between IC and stream health
- IC data available statewide
- Measurable and generated by local land use
- We can do something about better land use decisions and stormwater

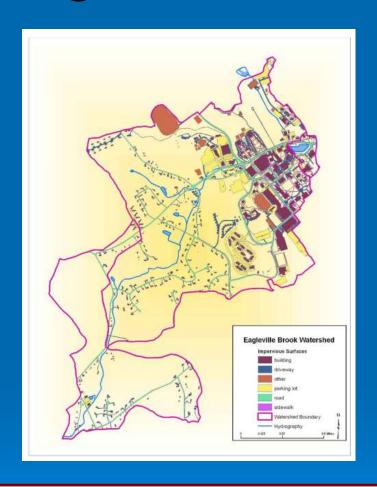

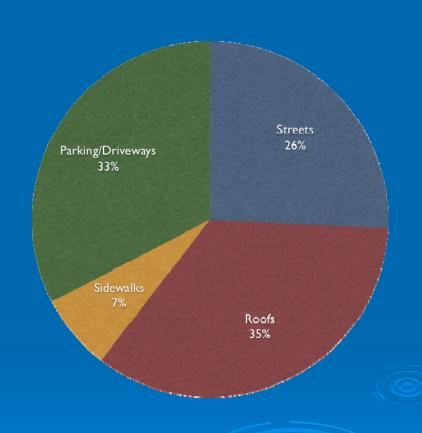

The IC-TMDL Location

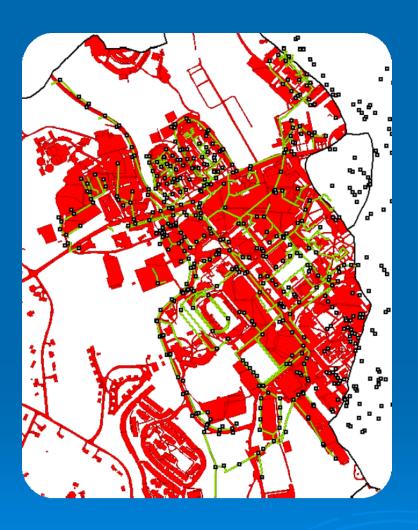

Eagleville Brook Watershed

Goal <u>Is Not</u> to reduce the % IC in the watershed per se, but to reduce the <u>impact</u> of IC through <u>stormwater management</u> to levels equivalent to < 11% IC.

Project Goals

- 1. Reduce IC where practical (i.e., remove or replace with pervious surfaces)
- 2. Disconnect IC from surface waterbody (e.g., disconnect roofs)
- 3. Minimize additional disturbance to natural areas
- 4. Retrofit with distributed BMPs to reduce runoff volumes & improve water quality
- 5. Increase tree canopy cover and restore permeability of open areas

Project Approach

- 1. Mapping Analysis
 - Actual IC acres vs TMDL estimates
- 2. On-the-Ground Reality Check
 - Revised drainage boundaries
 - Connected vs disconnected IC
 - Retrofit potential
- 3. Bean Counting
 - Do IC reductions = improved biota?
 - Ultimately, success will be measured by assessing aquatic life directly Interim measurements IC reduction, flow

Mapping Analysis

➤ Original IC estimates based on 2002 state data and land use coefficients

Revised IC based on GIS measurements 2008

aerials

BASIN NUMBER				
3100-19-1 (Upper)	126	194		
3100-19-1-L1 (Swan Lake)	3.6	6.4		
3100-19-2-R1 (Lower)	15.6	14.9		

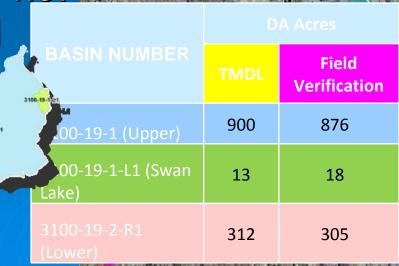

On-the-Ground Reality Check

Revisions to drainage boundaries changes TMDL DA and IC assumptions

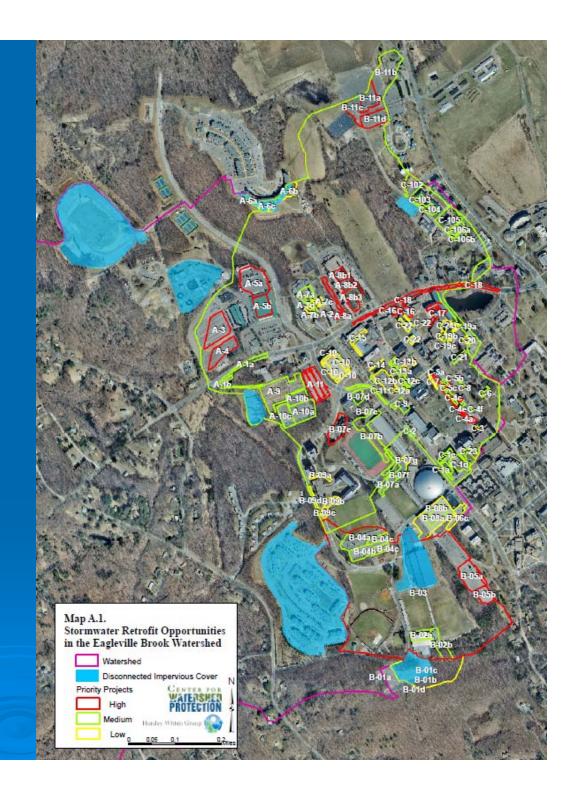

Swan Lake may not be in watershed

On-the-Ground Reality Check

- What counts as "disconnected" IC?
 - Drains to pervious area
 - Managed by existing BMP
- > 51 IC acres already disconnected in "upper" subbasin

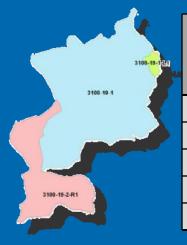

What is "effective" pervious cover?

	Existing Conditions			
Eagleville Brook Watershed	TMDL Estimated	GIS Measured	Field Adjusted	
Watershed DA (acres)	1225	1225	1199 ^c	
Watershed IC (acres)	145ª	216 ^b	165 ^d	
% Watershed IC	12%	18%	14%	
11% IC TMDL target (acres)	135	135	132	
Remaining IC to manage (acres)	10	81	33	

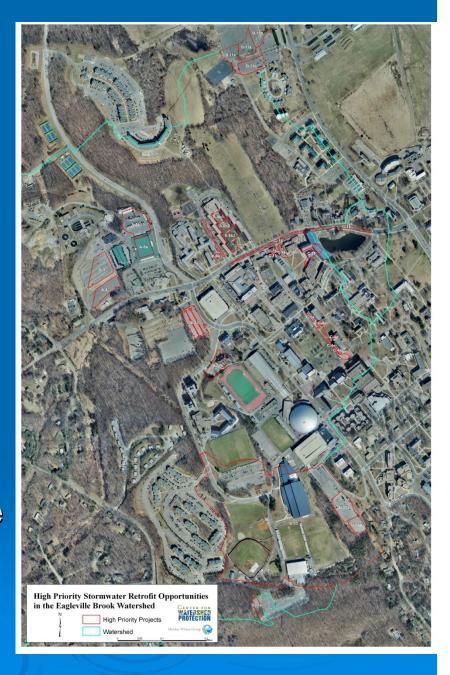

Eagleville Brook Watershed	Existing Conditions			
Upper "Basin" 3100-19-1	TMDL Estimated	GIS Measured	Field Adjusted	
3100-19-1 DA (acres)	900	900	876°	
3100-19-1 IC (acres)	126 ^a	194 ^b	143 ^d	
% IC	14%	22%	16%	
11% IC TMDL target (acres)	99	99	96	
Remaining IC to manage (acres)	27	95	47	

- ^a IC estimated using land use coefficients and 2002 ISAT data
- ^b IC measured from GIS mapping of 2008 high resolution imagery
- ^c Field assessment revealed areas that did not drain to Eagleville Brook
- ^d Field assessment identified 51 acres of watershed IC was already disconnected and should not be considered "effective."

On-the-Ground Reality Check

- > 50 sites visited
- > 110 individual retrofits identified
- 127 IC acres potentially managed
- Met with UConn planners, researchers, facility managers
- Link with Master Plans and Landscaping
- Rank "top 10" projects
- 25% design concepts to manage
 32 IC acres

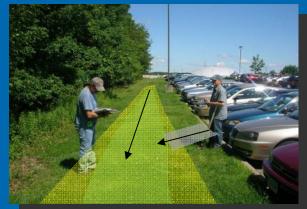

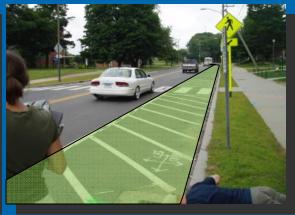

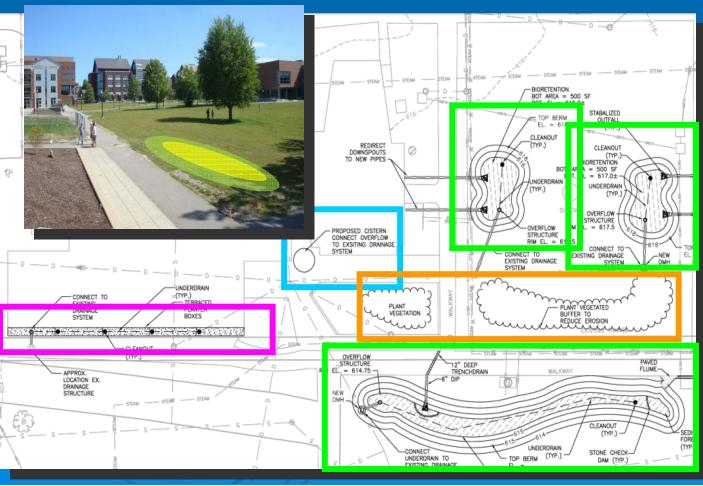

Retrofits Types

- > Bioretention
- > Swales
- Tree planters/filters
- Gravel-based wetland
- > Sand filter
- > Green roofs
- > Cisterns
- Pervious pavement
- SoilAmendments

Large surface parking lots

Redesign large surface parking lots to make use of bioretention

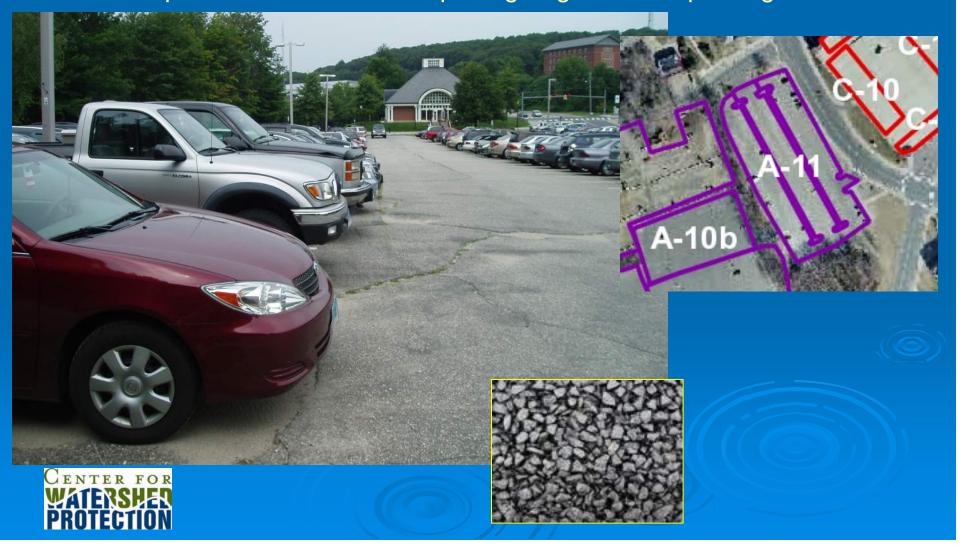

Large surface parking lots

Reduce impervious cover when repaving large surface parking lots.

Center campus / academic core

Concentrate on roof runoff using green roofs, cisterns, and rooftop leader disconnects to rain gardens

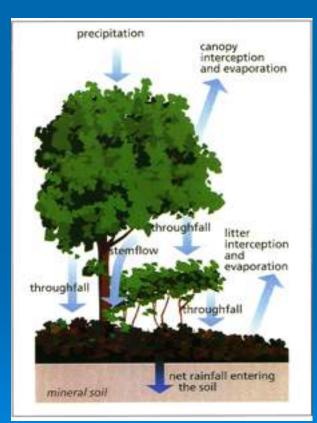

Center campus / academic core

Increase tree cover in collaboration with UConn Master Landscape Plan

From draft Landscape Master Plan

Trees can be major stormwater control devices!

Roads

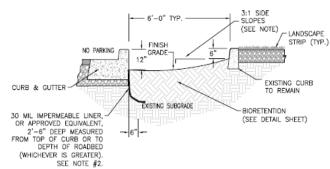

Combine aesthetics, stormwater management & safety with traffic calming & vegetated strips

Ranking Factors: TOP 10

- Amount of IC removed/ disconnected
- Integration with other campus planning/improvements
- Use of different LID practices
- Distribution across campus (location and use, e.g., academic buildings, dorms, parking lots)
- Feasibility (timeline & cost)
- WQ benefits beyond just reduction of volume

Bean Counting

1. Volume Reduction

- Stream volume monitoring at downstream weir
- Runoff reduction estimates as retrofits occur
- Possible runoff red. modeling by UConn Engineering Dept.

2. Impervious Cover Mitigation

- IC removed (pervious lots)
- IC disconnected (bioretention)
- % credits depending on practice?

3. Beyond Volume & Cover

- Water quality projects (gravel wetland, pollution prevention)
- Rehabilitate & plant trees
- Rehabilitate soils
- Restore stream buffers

4. Back to the Bottom-Line Bugs

Table 2. Project Benefits Summary						
	Impervious Cover Drainage Area Treated (acres)	Watershed Treated (%)	TP Removed (lb/yr)	TN Removed (lb/yr)	TSS Removed (lb/yr)	Runoff Reduction (cf)*
High Priority Projects	31.88	2.6	33	207	6,433	18,881
All Projects	127.19	22	72	517	14890	55,167

^{*}The runoff reduction represents the reduction in runoff for a 1" storm event

Does not yet account for all projects in action

Eagleville Brook Watershed	Existing	Future IC with Retrofit Implementation		
	Conditions*	"Top 10" Projects	All Projects	
Watershed DA (acres)	1199	1199	1199	
Watershed IC (acres)	165	133**	38***	
% Watershed IC		11%	3.2%	
11% IC TMDL target (acres)		Toward mot	Target	
Remaining IC to manage (acres)		Target met	exceeded	

Eagleville Brook Watershed Upper "Basin"	Existing	Future IC with Retrofit Implementation		
3100-19-1	Conditions*	"Top 10" Projects	All Projects	
3100-19-1 DA (acres)	876	876	876	
3100-19-1 IC (acres)	143	111**	16***	
% IC	16%	13%	2%	
11% IC TMDL target (acres)	96	Target net met	Target	
Remaining IC to manage (acres)	47	Target not met	exceeded	

- * Using field adjusted watershed DA and IC values
- ** Projects manage a total of 32 acres IC (subtract from 143 acres)
- *** Projects manage a total of 127 acres IC (subtract from 143 acres).

 Assumes B7g option 1; Discounts C15 (already completed) and double treatment by A2.

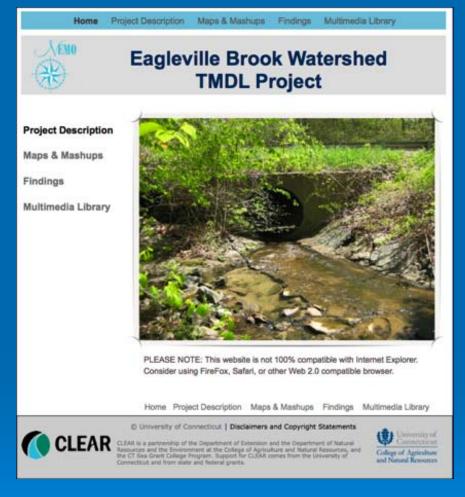

Implications for Others?

- Setting IC targets
 - Others in Region 1 (ME, CT...)
 - Swift Creek, NC has a 9% IC Target
 - What are protocols for establishing existing and "effective" IC?
- > What if not enough on-the-ground opportunities?
 - Lack of publicly-owned properties
 - No single large land owner like UConn
- Elevates LID as a preferred approach to stormwater management in impaired (and non-impaired) waters
